ABOUT THIS GUIDE

Thank you and congratulations on your purchase of the DES-1228P 24-Port 10/100Mbps Fast Ethernet + 4 10/100/1000Base-T Ports and 2 Combo SFP PoE Web-Smart Switch. This device integrates 1000Mbps Gigabit Ethernet, 100Mbps Fast Ethernet and 10Mbps Ethernet network capabilities in a highly flexible package. Since Ports 1~24 of this Switch are Power over Ethernet (PoE) ports, it will automatically detect the presence of IEEE 802.3af compliant devices and will provide power through these PoE ports. The Switch provides up to 15.4Watts per port and can be connected to WLAN access points, IP phones, video cameras, and other PD devices. The Switch will automatically detect the network appliance's requirements, and the Switch will supply the required power current to each appliance.

Purpose

This guide will show you how to install and use the configuration functions of the DES-1228P Web-Smart Switch step-by-step.

Terms/Usage

In this guide, the term “Switch” (first letter capitalized) refers to the DES-1228P Smart Switch, and “switch” (first letter lower case) refers to other Ethernet switches. Some technologies refer to terms “switch”, “bridge” and “switching hubs” interchangeably, and both are commonly accepted for Ethernet switches.

INTRODUCTION

This chapter will describe the features of the DES-1228P and provide some background information about Ethernet/Fast Ethernet/Gigabit Ethernet switching technology.

Gigabit Ethernet Technology

Gigabit Ethernet is an extension of IEEE 802.3 Ethernet utilizing the same packet structure, format, and support for CSMA/CD protocol, full duplex, and management objects, but with a tenfold increase in theoretical throughput of over 100-Mbps Fast Ethernet and a hundredfold increase over 10-Mbps Ethernet. Since it is compatible with all 10-Mbps and 100-Mbps Ethernet environments, Gigabit Ethernet provides a straightforward upgrade without wasting existing investments in hardware, software, or trained personnel.

The increased speed and extra bandwidth offered by Gigabit Ethernet is essential to help solving network bottlenecks that frequently develop as more advanced computer users and newer applications continue to demand greater network resources. Upgrading key components, such as backbone connections and servers to Gigabit Ethernet technology can greatly improve network response times as well as significantly speed up the traffic between subnets.

Gigabit Ethernet enables fast optical fiber connections to support video conferencing, complex imaging, and similar data-intensive applications. Likewise, since data transfers occur 10 times faster than Fast Ethernet, servers outfitted with Gigabit Ethernet NIC's are able to perform 10 times the number of operations in the same amount of time.

In addition, the phenomenal bandwidth delivered by Gigabit Ethernet is the most cost-effective method to take advantage of today and tomorrow's rapidly improving switching and routing internetworking technologies. And with expected advances in the coming years in silicon technology and digital signal processing that will enable Gigabit Ethernet to eventually operate over unshielded twisted-pair (UTP) cabling, outfitting your network with a powerful 1000-Mbps-capable backbone/server connection which will create a flexible foundation for the next generation of network technology products.

Fast Ethernet Technology

The growing importance of LANs and the increasing complexity of desktop computing applications are fueling the need for high performance networks. A number of high-speed LAN technologies have been proposed to provide greater bandwidth and improve client/server response times. Among them, 100BASE-T (Fast Ethernet) provides a non-disruptive, smooth evolution from the current 10BASE-T technology. The non-disruptive and smooth evolution nature, and the dominating potential market base, virtually guarantees cost-effective and high performance Fast Ethernet solutions.

100Mbps Fast Ethernet is a standard specified by the IEEE 802.3 LAN committee. It is an extension of the 10Mbps Ethernet standard with the ability to transmit and receive data at 100Mbps, while maintaining the CSMA/CD Ethernet protocol. Since the 100Mbps Fast Ethernet is compatible with all other 10Mbps Ethernet environments, it provides a straightforward upgrade and utilizes existing investments in hardware, software, and personnel training.

Switching Technology

Another approach to push beyond the limits of Ethernet technology is the development of switching technology. A switch bridges Ethernet packets at the MAC address level of the Ethernet protocol transmitting among connected Ethernet or Fast Ethernet LAN segments.

Switching is a cost-effective way of increasing the total network capacity available to users on a local area network. A switch increases capacity and decreases network loading by dividing a local area network into different segments, which won't compete with each other for network transmission capacity.

The switch acts as a high-speed selective bridge between the individual segments. The switch, without interfering with any other segments, automatically forwards traffic that needs to go from one segment to another. By doing this the total network capacity is multiplied, while still maintaining the same network cabling and adapter cards.

Power over Ethernet (PoE)

Power over Ethernet (PoE) integrates power and data onto one single cabling infrastructure, eliminating the need to have AC power available at all locations.

Power and Data are integrated onto the same cable. Supporting category 5/5e up to 100 Meters, PoE will provide power to PoE compatible devices, such as IP telephones, wireless LAN access points, and IP security cameras.

PoE is already widely adopted in the market, saving up to 50% of overall installation costs by eliminating the need to install separate electrical wiring and power outlets.

Features

- ◆ Address Table: Supports up to 8K MAC address per device
- ◆ Supports a packet buffer of up to 128K Bytes
- ◆ 1-24 10/100M ports support up to 15.4W power which complies the IEEE802.3af Power over Ethernet standard.
- ◆ IGMP Snooping support
- ◆ IEEE802.1D Spanning Tree
- ◆ Support static Port Trunk
- ◆ IEEE802.3x flow control in full duplex mode
- ◆ Port Mirroring support
- ◆ IEEE802.1Q VLAN
- ◆ IEEE802.1p Priority Queues
- ◆ IEEE802.1x Port-based Access Control
- ◆ Supports Broadcast Storm Control
- ◆ Supports Static MAC setting
- ◆ D-Link Safeguard Engine support
- ◆ Supports Simple Network Management Protocol(SNMP)
- ◆ MIB support for: RFC1213 MIB II, Private MIB
- ◆ Supports DHCP client
- ◆ Supports Port setting for Speed, Duplex Mode

- ◆ Easy configuration via Web Browser
- ◆ Easy setting via SmartConsole Utility
- ◆ Firmware backup and upload via Web GUI
- ◆ System reboot via Web GUI
- ◆ Provides parallel LED display for port status such as link/act, speed, etc.
- ◆ Reset configuration (hardware and Web GUI)

Technical Specifications

Key Components / Performance	
Switching Capacity	12.8Gbps
Max. Forwarding Rate	10M: 14,880 pps 100M: 148,809 pps 1G: 1,488,095 pps
Forwarding Mode	Store and Forward
Packet Buffer memory	128K Bytes
SDRAM for CPU	8M Bytes
Flash Memory	Prom 2M Bytes
Port Functions	
LAN	- 24 x 10/100BaseT ports - Compliant with the following standards: IEEE 802.3 compliance

	<ol style="list-style-type: none"> 1. IEEE 802.3u compliance 2. Supports Full-Duplex operations at 10/100Mbps, and 1000Mbps only on SFP ports
<p>Combo ports in the front panel</p>	<ul style="list-style-type: none"> - 2 Combo 1000Base-T/SFP ports -1000Base-T ports compliant to the following standards: <ol style="list-style-type: none"> 1. IEEE 802.3 compliance 2. IEEE 802.3u compliance 3. IEEE 802.3ab compliance 4. Support Full-Duplex operations - SFP Transceivers Supported: <ol style="list-style-type: none"> 1. DEM-310GT (1000BASE-LX) 2. DEM-311GT (1000BASE-SX) 3. DEM-314GT (1000BASE-LH) 4. DEM-315GT (1000BASE-ZX) 5. DEM-312GT2 (1000BASE-SX), up to 2km 6. DEM-210 (100BASE-FX), up to 2km, Multi-Mode 7. Power over Ethernet	
PoE Capable Ports	Port 1-24
PoE Specification	<ol style="list-style-type: none"> 1. Supplies power to PD device up to 15.4W per port, meeting IEEE802.3af standards and more sufficiently is able to provide power to PD devices 2. Power Budget: 170W max 3. Auto discovery feature, automatically recognize the connection of PD device and immediately sends power to it 4. Auto disable port if the port current is over 350mA while other ports remain active 5. Active circuit protection, automatically disables the port if there is a short while other ports remain active

	6. Provide the power following the classification below																		
	<table border="1"> <thead> <tr> <th>Class</th> <th>Usage</th> <th>Minimum power levels at output of PSE</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Default</td> <td>15.4W</td> </tr> <tr> <td>1</td> <td>Optional</td> <td>4.0W</td> </tr> <tr> <td>2</td> <td>Optional</td> <td>7.0W</td> </tr> <tr> <td>3</td> <td>Optional</td> <td>15.4W</td> </tr> <tr> <td>4</td> <td>Reserved</td> <td>15.4W</td> </tr> </tbody> </table>	Class	Usage	Minimum power levels at output of PSE	0	Default	15.4W	1	Optional	4.0W	2	Optional	7.0W	3	Optional	15.4W	4	Reserved	15.4W
	Class	Usage	Minimum power levels at output of PSE																
	0	Default	15.4W																
	1	Optional	4.0W																
	2	Optional	7.0W																
	3	Optional	15.4W																
4	Reserved	15.4W																	
7. DES-1228P follow the PSE pinout standard of Alternative A which is sending out power over number 1,2,3,6 pins of 8 wires of CAT5 UTP cable																			
Chassis																			
Dimensions	19-inch, 1U Rack-mount size 440mm x 210mm x 44mm																		
Reset button on the front panel	A factory reset button x 1																		
Physical & Environment																			
AC input	100~240 VAC, 50/60Hz Internal universal power supply																		
Operation Temperature	0~40°C																		
Storage Temperature	-10~70°C																		

Humidity	Operation: 10%~90% RH Storage: 5%~90% RH
Power consumption	222 watts
Heat Dissipation	750.2 btu/hr
MTBF	149,676 (hours)
Emission (EMI) and Safety Certifications	
EMI-EMC Compliance: FCC class A, CE Class A, VCCI Class A Safety Compliance: cUL, UL	

UNPACKING AND INSTALLATION

This chapter provides unpacking and installation information for the Web-Smart Switch.

Unpacking

Carefully unpack the contents of the Web-Smart Switch from the box and locate the following items:

One DES-1228P Web-Smart Switch

One AC power cord, suitable for the local electrical power voltage requirements

Four rubber feet to be used for shock cushioning

Screws and two mounting brackets

CD-Rom with the SmartConsole Utility application, which includes the full User's Guide

Quick Installation Guide

If any item is found missing or damaged, please contact the reseller for replacement.

Installation

The site chosen for installation greatly affects the Web-Smart Switch's performance. When installing, consider the following points:

Install the Switch in a fairly cool and dry place. Technical Specifications such as operating temperatures and other important information can be found on page 8 of this manual.

Install the Switch in a site free from strong electromagnetic field generators (such as motors), vibration, dust, and direct exposure to sunlight.

Leave at least 10cm (about 4 inches) of space to the front and rear of the Switch for ventilation.

Install the Switch on a sturdy, level surface that can support its weight, or in an EIA standard-size equipment rack. For information on rack installation, see the next section, *Rack Mounting*.

When installing the Switch on a level surface, attach the rubber pads (feet) to the bottom. The rubber feet cushion the switch and helps protect the case from scratches.

Figure 1 – Attach the adhesive rubber pads to the bottom

Rack Mounting

The Switch can be mounted in an EIA standard-size, 19-inch rack or chassis, which can be placed in a wiring closet with other equipment. Attach the mounting brackets to both sides of the Switch (one on each side), and secure them with the provided screws.

Figure 2 – Attach the mounting brackets to the Switch

Use the screws provided with the equipment rack or chassis to mount the Switch in the rack.

Figure 3 – Mount the Switch in the rack or chassis

Connecting Network Cables

The DES-1228P has 24 ports that support 10/100Mbps Fast Ethernet; it also has 4 10/100/1000Base-T Ports and 2 Combo SFPs. Each port on the DES-1228P supports Auto-MDI/MDI-X. Auto-MDI/MDI-X is a feature that enables the switch to auto sense what kind of cable is used on a port (straight or crossover). This allows any type of cables to be used with the switch regardless of what device is being connected.

AC Power

The Switch utilizes an AC power supply 100~240V AC, 50~60Hz. The power switch is located at the rear of the unit adjacent to the AC power connector and the system fan.

The switch's power supply will adjust to the local power source automatically and may be turned on without having any or all LAN segment cables connected.

IDENTIFYING EXTERNAL COMPONENTS

This chapter describes the front panel, rear panel, and LED indicators of the Switch.

Front Panel

The figure below shows the front panel of the Switch.

Figure 4 – Front panel of the 28-port Web-Smart Switch

LED Indicator:

Comprehensive LED indicators display the status of the switch and the network (see the *Understanding LED Indicators* section).

10/100 BASE-TX Twisted Pair Ports (Port 1~24)

The DES-1228P is equipped with 24 Fast Ethernet twisted pair ports that are auto-negotiable 10/100Mbps and also support auto MDI/MDIX crossover detection. All these 24 ports can operate in half- and full- duplex modes, and will be automatically activated when a compatible terminal is identified. The Switch will provide the power needed through the PoE port to the connected PD.

For Legacy devices that are not yet compatible, the PoE port will not offer the power to these devices. This feature allows users to freely and safely mix legacy and Power over Ethernet compatible devices on their network.

10/100/1000 BASE-T / Mini GBIC Combo Ports (Option Port 25~26)

The Switch is also equipped with two combo 10/100/1000 Base-T / Mini GBIC ports, supporting optional 100BASE-FX or 1000BASE-SX/LX Mini GBIC modules for fiber uplinks.

10/100/1000 BASE-T Twisted Pair Ports (Port 27~28)

Finally there are 2 Gigabit twisted pair ports that are auto negotiable 10/100/1000Mbps with auto MDI/MDIX crossover detection support that can also operate in half- and full- duplex modes.

Note: When a port is set to “Forced Mode”, the Auto MDI/MDIX is disabled.

Rear Panel

Figure 5 – Rear panel of the Switch

AC Power Connector:

Plug in the female connector of the provided power cord into this connector, and the male into a power outlet. Supported input voltages range from 100-240V AC, and 50-60Hz.

Understanding LED Indicators

The front panel LEDs provides instant status feedback and simplifies monitoring and troubleshooting tasks.

Figure 6 – LED indicators of the Switch

Reset button:

The Reset button resets all configuration settings back to the factory

default.

Note: Be sure that to record all custom settings of the Switch before pressing the reset button. Resetting the Switch back to factory default settings will erase all custom configurations.

Power and System LEDs

Power LEDs

On	When the Power LED light is on, the Switch is receiving power.
Off	When the Power LED light is off, the power cord is not or improperly connected.

CPU LEDs (Management Indicator)

Blinking	When the CPU is working, the CPU LED is blinking.
Off	The CPU is idle.

Ports 1 ~ 24 Status LEDs

Link/Act

On	When the Link/Act LED light is on, the respective port is successfully connected to an Ethernet network.
Blinking	When the Link/Act LED is blinking, the port is transmitting or receiving data on the Ethernet network.
Off	No link.

100Mbps

On	When the 100Mbps LED light is on, the respective port is connected to a 100Mbps Fast Ethernet network.
Off	When the respective port is connected to a 10Mbps Ethernet or no link.

PoE

Green Light	When the Green light is on, the respective port is providing 48V of power.
Off	When the light is off, either the respective port is receiving power from an AC power source or no 802.3af PD is found.
Red Light	When the Red light is on, an error has occurred at the respective port.

Option Ports 25~26 10/100/1000 Base-T / Mini-GBIC Status LEDs

FX Link

On	When the FX Link LED light is on, the respective port is connected to a 100 or 1000Mbps Gigabit Ethernet network.
Off	No link or linking to copper ports.

Link/Act

On	When the respective combo port is connected to a network, the Link/Act LED light is on.
Blinking	When the LED is blinking, the respective combo port is transmitting or receiving data on a network.
Off	No link.

1000Mbps

On	When the 1000Mbps LED light's on, the respective port is connected to a 1000Mbps Gigabit Ethernet network.
Off	When the respective port is connected to a 100Mbps Fast Ethernet or no link.

100Mbps

On	When the 100Mbps LED lights on, the respective port is connected to a 100Mbps Fast Ethernet network.
Off	When the respective port is connected to a 1000Mbps Gigabit Ethernet network or no link.

Ports 27~28 10/100/1000 Base-T LEDs

Link/Act

On	When the Link/Act LED light is on, the respective port is successfully connected to an Ethernet network.
----	--

Blinking	When the Link/Act LED is blinking, the port is transmitting or receiving data on the Ethernet network.
Off	No link.

1000Mbps

On	When the 1000Mbps LED light is on, the respective port is connected to a 1000Mbps Gigabit Ethernet network.
Off	When the respective port is connected to a 10Mbps Ethernet or 100Mbps Fast Ethernet network, or no link.

100Mbps

On	When the 100Mbps LED light is on, the respective port is connected to a 100Mbps Fast Ethernet network.
Off	When the respective port is connected to a 10Mbps Ethernet or 1000Mbps Gigabit Ethernet network.

CONFIGURATION

Through a web browser, the features and functions of the DES-1228P Switch can be configured for optimum use.

Supported web browsers

The embedded Web-based Utility currently supports the following web browsers:

- Microsoft Internet Explorer ver. 6.0, 5.5
 - Mozilla ver. 1.7.12, 1.6
 - Firefox ver. 1.5, 1.0.7
 - Netscape ver. 8.0.4, 7.2
 - Opera ver. 8.5, 7.6
 - Safari ver. 2.0.2
-

Installing the SmartConsole Utility

The SmartConsole Utility allows a user to monitor and configure multiple D-Link Web-Smart Switches from a workstation connected to the network. Follow these steps to install the SmartConsole Utility:

1. Insert the Utility CD in your CD-Rom Drive.
 2. From the **Start** menu on the Windows desktop, choose **Run**.
 3. In the **Run** dialog box, type D:\SmartConsole Utility\setup.exe (where D:\ represents the drive letter of your CD-Rom) and click **OK**.
 4. Follow the on-screen instructions to install the utility program.
 5. Upon completion, go to **Program Files > SmartConsole Utility** and execute the SmartConsole Utility.
-

SmartConsole Utility Features

The SmartConsole Utility is divided into four parts, a *Menu Toolbar* of functions at the top, *Discovery List*, *Monitor List*, and *Device Setting*.

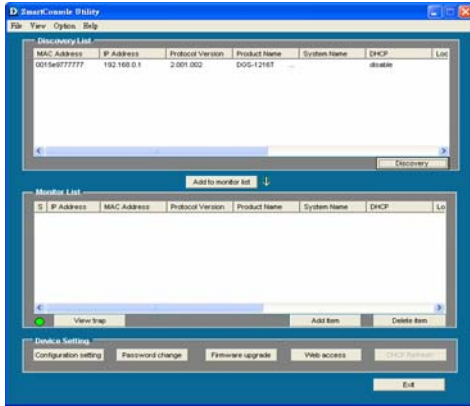

Figure 7 – SmartConsole Utility

Menu Toolbar

The Menu Toolbar in the SmartConsole Utility has four main tabs, File, View, Option, and Help.

File includes: *Monitor save*, *Monitor save as*, *Monitor load* and *Exit*.

- **Monitor Save:** To record the setting of the Monitor List as default for the next time the SmartConsole Utility is used.
- **Monitor Save As:** To record the setting of the Monitor List in an appointed filename and file path.

- **Monitor Load:** To manually load a Monitor List setting file.
- **Exit:** To exit the SmartConsole Utility.

View includes: *View log* and *Clear Log* functions, which provide trap setting list operations.

- **View Log:** To show the event of the SmartConsole Utility and the device.
- **Clear Log:** To clear all log entries.

Option includes: *Refresh Time* and *Group Interval* functions.

Refresh time ▶
Group Interval

- **Refresh time** refreshes the monitoring time of the device. Choices include *15 secs, 30 secs, 1 min, 2 min and 5 min* for selecting the monitoring time intervals.
- **Group Interval** establishes the intervals (in seconds) that the Web-Smart Switch will be discovered in the SmartConsole Utility Discovery List.

NOTE: If the Group Interval is set to 0, IGMP snooping must be disabled or else the Web-Smart Switch will not be discovered.

Help includes: information *About* the SmartConsole Utility, such as the software version.

Discovery List

This is the list where all Web-Smart devices on the network are discovered.

By pressing the **Discovery** button, all the Web-Smart devices are listed in the discovery list.

Double click or press the **Add to monitor list** button to select a device from the Discovery List to the Monitor List.

Definitions of the Discovery List features:

MAC Address: Shows the device MAC Address.

IP Address: Shows the current IP addresses of devices.

Protocol version: Shows the version of the Utility protocol.

Product Name: Shows the device product name.

System Name: Shows the appointed device system name.

DHCP: Uses a client/server model to obtain lease of an IP address from a DHCP server as part of the network boot process.

Location: Shows where the appointed device location.

Trap IP: Shows the IP where the Trap information will be sent.

Subnet Mask: Shows the Subnet Mask set of the device.

Gateway: Shows the Gateway set of the device.

Group Interval: Shows the Group Interval of the device.

Monitor List

All Web-Smart devices in the Monitor List can be monitored, with Trap information available to be received for monitoring status information of the device.

Definitions of the Monitor List functions and terms:

S: Shows the system symbol of the Web-Smart device,  represents the device system is inactive.

IP Address: Shows the current IP address of the device.

MAC Address: Shows the device MAC Address.

Protocol version: Shows the version of the Utility protocol.

Product Name: Shows the device product name.

System Name: Shows the appointed device system name.

DHCP: uses a client/server model to obtain lease of an IP address from a DHCP server as part of the network boot process.

Location: Shows where the device is located.

Trap IP: Shows the IP where the Trap to be sent.

Subnet Mask: Shows the Subnet Mask set of the device.

Gateway: Shows the Gateway set of the device.

Group Interval: Shows the Group Interval of the device.

View Trap: The view trap function receives trap events from the Web-Smart Switch.

There is a light indicator following the “**View Trap**” button. A green light indicates that the monitor has not received any new traps, while a red light indicates that there are new traps received by the monitor available to view. (Figure 8)

Figure 8 – View trap

When the “**View Trap**” button is clicked, a Trap Information window will pop up, showing the trap information, such as Symbol, Time, Device IP and the Event occurred. (Figure 9)

The symbol “” represents a new trap signal, and will disappear after the event record is reviewed (clicked).

Figure 9 – Trap information

Note: To receive Trap information, the switch must be configured with Trap IP and Trap Events, available from the Trap Setting menu.

Add Item: Adds a device to the Monitor List manually, by entering the IP Address of the device to monitor.

Delete Item: Deletes the device from the Monitor List.

Device Setting

Function buttons of the Device Setting section provide several options.

Configuration Setting: In the Configuration Setting, the following settings are available: Product Name, MAC Address, IP Address, Subnet Mask, Gateway, Set Trap to (Trapping IP Address), System name, Location, Password and DHCP ON/OFF (OFF is default).

After selecting the device from the Discovery List or Monitor List and pressing Configuration Setting, modify the information necessary and press “Set”.

The screenshot shows a dialog box titled "Configuration setting" with a close button in the top right corner. It contains several input fields and checkboxes arranged in two columns. The left column includes: Product name (JGG-126T), IP Address (172 . 21 . 47 . 89), Gateway (172 . 21 . 32 . 254), System name (jgsh), Password (a masked field), and a DHCP section with radio buttons for "Enable" (selected) and "Disable". The right column includes: MAC Address (0050e8777777), Subnet mask (255 . 255 . 240 . 0), Set trap to (172 . 21 . 47 . 91), Location (Software), and Group Timer (0). At the bottom, there are "Set" and "Cancel" buttons.

Figure 10 – Configuration Setting

Password Change: To change the password, fill in the new and original password, and press “Set”.

The screenshot shows a dialog box titled "Password change" with a close button in the top right corner. It contains three input fields: "New password", "Original password", and "Confirm password". At the bottom, there are "Set" and "Cancel" buttons.

Figure 11 – Password Change

This space has been intentionally reserved for notes:

Firmware Upgrade: To update the device firmware, enter the firmware path and password (if necessary), and click “Start”).

Figure 12 – Firmware Upgrade

Web Access: Double click the device in the Monitor List or select a device in the Monitor List and press the “**Web Access**” button to open the Web-based Utility. To see the list of web browsers the Web-based Utility supports, see *Supported web browsers* on page 22.

DHCP Refresh: select a device in the Monitor List and press the “**DHCP Refresh**”, and enter the password (if applicable) to trigger the Web-Smart Switch to request an IP address from a DHCP Server.

Figure 13 – DHCP Refresh

Web-based Utility

The DES-1228P Web-Smart Switch has a web browser GUI interface for configuring the Switch through a web browser. To see the list of web browsers the Web-based Utility supports, see *Supported web browsers* on page 22. A network administrator can manage, control and monitor the switch from the local LAN. This section indicates how to configure the Switch to enable its smart functions.

Login

In order to login and configure the switch via an Ethernet connection, the PC must have an IP address in the same range as the switch. For example, if the switch has an IP address of 192.168.0.1, the PC should have an IP address of 192.168.0.x (where x is a number between 2 and 254), and a subnet mask of 255.255.255.0. Open your web browser and enter `http://192.168.0.1` (the factory-default IP address) in the address box. Then press <Enter> (Figure 14)

Figure 14 – Logging into the Switch's (DHCP assigned) IP address

The web configuration can also be accessed through the SmartConsole Utility. Open the SmartConsole Utility and double-click the switch as it appears in the Monitor List. This will automatically load the web configuration in your web browser.

When the following logon box appears, enter "admin" for the password. Press **Ok** to enter the main configuration window. (Figure 15)

Figure 15 – Log in screen

Once you have successfully logged in, the device status page will appear. In the top right corner the *user name* (default 'admin') is displayed with the *IP address* of the Switch. Below this is a *Logout* option for use when the session is complete.

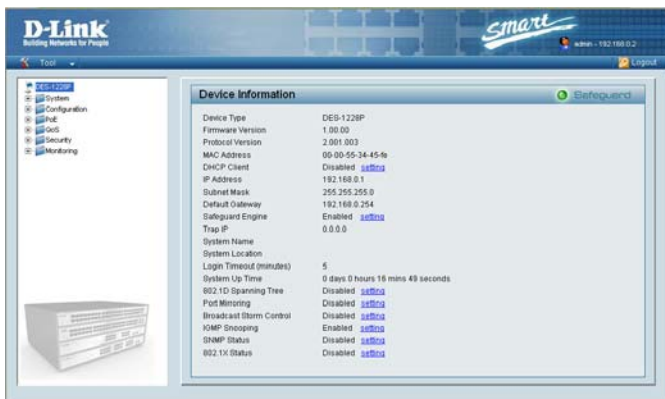

Figure 16 – Device Status

Tool Menu

The Tool Menu offers global function controls such as Reset, Configuring Backup and Restoration, Firmware Backup and Upload, and System Reboot.

Figure 17 – Tool Menu

Reset: Provides a safe reset option for the Switch. All configurations will be reset to default.

Figure 18 – Tool Menu > Reset

Configure Backup and Restore: Allows the current configuration settings to be saved to a file (not including the password), and if necessary, to be restored from a backup.

Figure 19 – Tool Menu > Configure Backup and Restore

Firmware Backup and Upload: Allows for the firmware to be saved, or for an existing firmware file to be uploaded to the Switch.

Figure 20 – Tool Menu > Firmware Backup and Upload

System Reboot: Provides a safe way to reboot the system. Ensure the configuration has been saved, or all the changes you just made may be lost after system reboot.

Figure 21 – Tool Menu > System Reboot

Setup Menu

All configuration options on the switch are accessed through the Setup menu on the left side of the screen (Figure22). Click on the setup item that you want to configure. The following sections describe in more detail each of the features and functions.

Figure 22 –Setup Menu

System > System Setting

The System Setting includes IP Information and System information. There are two ways for the switch to attain IP: Static and DHCP (Dynamic Host Configuration Protocol).

When using static mode, the **IP Address**, **Subnet Mask** and **Gateway** can be manually configured. When using DHCP mode, the Switch will first look for a DHCP server to provide it with an IP address, network mask, and default gateway before using the default or previously entered settings. By default the IP setting is static mode.

By entering a **System Name** and **System Location**, the device can more easily be recognized through the SmartConsole Utility and in other Web-Smart devices on the LAN. The **Login Timeout** controls the idle time-out for security purposes, when there is no action in the Web-based Utility. When the Login Timeout expires, the Web-based Utility requires a re-login before using the Utility again. The **Group Interval** send IGMP v1 report packet by switch, it is for SmartConsole Utility to discovery our switch when we in IGMP

protocol, zero means disable Group Interval, and 120~1225 means send IGMP v1 report according the value which unit is seconds.

IP Information	
<input type="radio"/> Static	<input checked="" type="radio"/> DHCP
IP Address	192 168 0 1
Subnet Mask	255 255 255 0
Gateway	192 168 0 254

System Information	
System Name	
System Location	
Login Timeout (minutes)	5

Figure 23 – System > System Setting

System > Trap Setting

By configuring the Trap Setting, it allows SmartConsole Utility to monitor specified events on this Web-Smart Switch. By default, Trap Setting is *Disabled*. When the Trap Setting is *Enabled*, enter the **Destination IP** address of the managing PC that will receive trap information.

Figure 24 – System > Trap Setting

System Event: Monitors the system's trapping information.

Device Bootup: Traps system boot-up information.

Illegal Login: Traps events of incorrect password logins, recording the IP of the originating PC.

Fiber Port Events: Monitors the fiber port status.

Link Up/Link Down: Traps fiber connection information.

Twisted pair Port Events: Monitors the copper cable port status.

Link Up/Link Down: Traps copper connection information.

System > Port Setting

In the Port Setting page, the status of all ports can be monitored and adjusted for optimum configuration. By selecting a range of ports

(“**From Port**” and “**To Port**”), the **Speed** can be set for all such ports, by clicking **Apply**. To refresh the information table to view the latest Link Status and Priority, press the **Refresh** button.

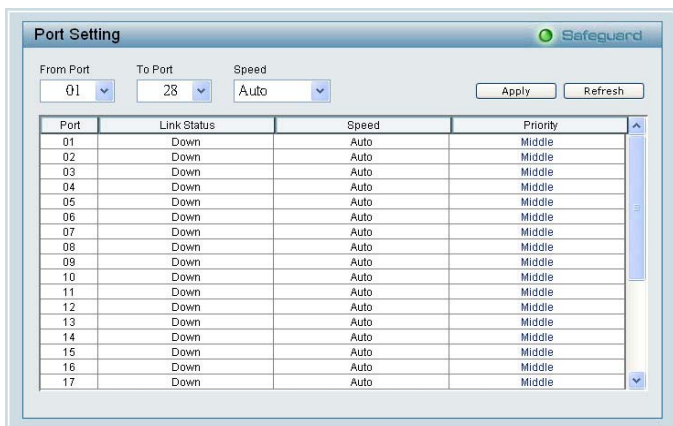

Figure 25 – System > Port Setting

Speed: Fiber connections can operate in Forced Mode settings (1000M Full), Auto, or Disable. Copper connections can operate in Forced Mode settings (100M Full, 100M Half, 10M Full, 10M Half), Auto, or Disable. The default setting for all ports is *Auto*. 100Base-FX Fiber supports 100M full/half force mode.

NOTE: Be sure to adjust port speed settings appropriately after changing connected cable media types.

Link Status: Reporting *Down* indicates the port is disconnected.

Priority: Displays each port's 802.1p QoS priority level for received data packet handling. Default setting for all ports is *Middle*. You can change the priority settings in *Qos > 802.1p Default Priority*

NOTE: When the Combo Gigabit Fiber port and the Copper ports are both connected, the Fiber port will take precedence over the Copper ports, meaning the Fiber port will be the only connection. But, for 100M Fiber module, the Fiber port will not take precedence over the Copper ports.

System > SNMP Setting

Simple Network Management Protocol (SNMP) is an OSI Layer 7 (Application Layer) designed specifically for managing and monitoring network devices. SNMP enables network management stations to read and modify the settings of gateways, routers, switches, and other network devices. Use SNMP to configure system features for proper operation, monitor performance and detect potential problems in the Switch or LAN.

Managed devices that support SNMP include software (referred to as an agent), which runs locally on the device. A defined set of variables (managed objects) is maintained by the SNMP agent and used to manage the device. These objects are defined in a Management Information Base (MIB), which provides a standard presentation of the information controlled by the on-board SNMP agent. SNMP defines both the format of the MIB specifications and the protocol used to access this information over the network.

Community Setting: In support of SNMP version 1, the Web-Smart Switch accomplishes user authentication by using Community Settings that function as passwords. The remote user SNMP application and the Switch SNMP must use the same community string. SNMP packets from a station that are not authenticated are ignored (dropped).

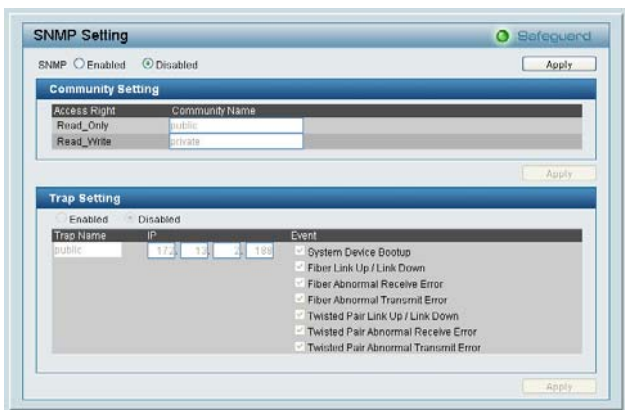

Figure 26 – System > SNMP Setting

Enabled / Disabled: Default setting is *Disabled*. Click *Enable*, then *Apply*, to set Community Settings.

The default community strings for the Switch used for SNMP v.1 management access are:

Public: The community with read-only privilege allows authorized management stations to retrieve MIB objects.

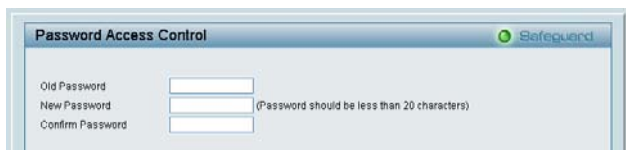

Private: The community with read/write privilege allows authorized management stations to retrieve and modify MIB objects.

Trap Setting: Traps are messages that alert network personnel of events that occur on the Switch. Such events can be as serious as a reboot (someone accidentally turned the Switch OFF), or less serious events such as a port status change. The Switch can generate traps and send them to the trap recipient (i.e. network administrator).

Setting up a Trap: Select *Enable*, enter a Trap Name (i.e. Trap Name must be selected from a Community Name), add the IP of the device to be monitored, and choose the event(s) to trap. The available trap Events to choose from include: System Device Bootup, Fiber Link Up / Link Down, Fiber Abnormal Receive Error, Fiber Abnormal Transmit Error, Twisted Pair Link Up / Link Down, Twisted Pair Abnormal Receive Error, Twisted Pair Abnormal Transmit Error.

System > Password Access Control

Setting a password is a critical tool for managers to secure the Web-Smart Switch. After entering the old password and the new password two times, press Apply for the changes to take effect.

The screenshot shows a web interface for 'Password Access Control'. At the top left is the title 'Password Access Control' and at the top right is a 'SafeGuard' logo. Below the title, there are three input fields: 'Old Password', 'New Password', and 'Confirm Password'. To the right of the 'New Password' field, there is a note: '(Password should be less than 20 characters)'.

Figure 27 – System > Password Access Control

Configuration > 802.1Q VLAN

A VLAN is a group of ports that can be anywhere in the network, but communicate as though they were in the same area.

VLANs can be easily organized to reflect department groups (such as R&D, Marketing), usage groups (such as e-mail), or multicast groups (multimedia applications such as video conferencing), and therefore help to simplify network management by allowing users to move devices to a new VLAN without having to change any physical connections.

The IEEE 802.1Q VLAN Configuration page provides powerful VID management functions. The original settings have the VID as 01, named “default”, and all 28 ports as “Untagged” (see Figure 29).

Rename: Click to rename the VLAN group.

Delete VID: Click to delete the VLAN group.

Add New VID: Click to create a new VID group, assigning ports from 01 to 28 as *Untag*, *Tag*, or *Not Member*. A port can be “Untagged” in only one VID. To save the VID group, press **Apply**.

You may change the name accordingly to the desired groups, such as the aforementioned R&D, Marketing, email, etc.

Figure 288 – Configuration > 802.1Q VLAN > Default Setting

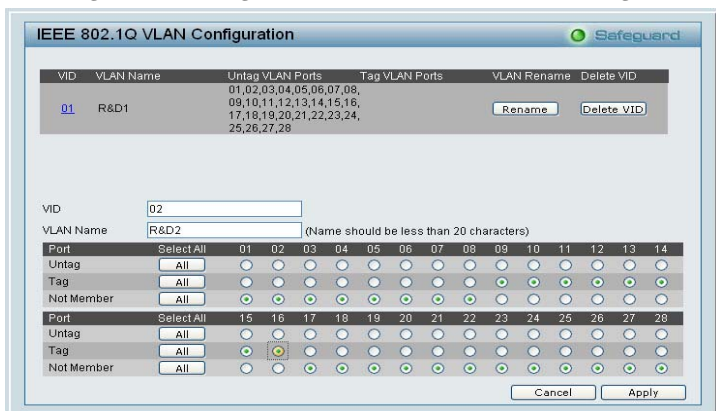

Figure 29 – Configuration > 802.1Q VLAN > Add VID

IEEE 802.1Q VLAN Configuration						Safeguard
VID	VLAN Name	Untag VLAN Ports	Tag VLAN Ports	VLAN Rename	Delete VID	
01	R&D1	01,02,03,04,05,06,07,08	09,10,11,12,13,14,15,16	<input type="button" value="Rename"/>	<input type="button" value="Delete VID"/>

Figure 301 – Configuration > 802.1Q VLAN > VID Assignments

Configuration > Trunking

The Trunking function enables the cascading of two or more ports for a combined larger bandwidth. Up to six Trunk groups may be created, each supporting up to 8 ports. Add a **Trunking Name** and select the ports to be trunked together, and click **Apply** to activate the selected Trunking groups.

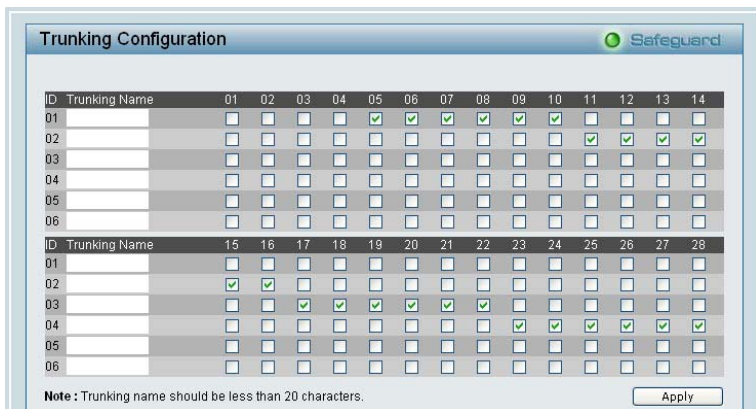

Figure 312 – Configuration > Trunking

NOTE: Each combined trunk port must be connected to devices within the same VLAN group.

Configuration > IGMP Snooping

With Internet Group Management Protocol (IGMP) snooping, the Web-Smart Switch can make intelligent multicast forwarding decisions by examining the contents of each frame's Layer 2 MAC header.

IGMP snooping can help reduce cluttered traffic on the LAN. With IGMP snooping enabled globally, the Web-Smart Switch will forward multicast traffic only to connections that have group members attached.

Please note that IGMP will not alter or route IP multicast packets. To send IP multicast packets across subnetworks a multicast routing protocol will be necessary.

The screenshot shows the 'IGMP Snooping Configuration' window. At the top, 'IGMP Snooping' is set to 'Disabled'. Under 'IGMP Global Setting', the following values are entered: Query Interval (125), Max Response Time (10), Robustness Variable (2), Last Member Query Interval (1), Host Timeout (260), Router Timeout (125), and Leave Time (1). An 'Apply' button is visible. Below is a table titled 'The VLAN Setting of IGMP snooping' with columns for VLAN ID, VLAN Name, State, Router Ports Setting, and Multicast Entry Table.

VLAN ID	VLAN Name	State	Router Ports Setting	Multicast Entry Table
01	R&D1	Enabled	Edit	View
02	R&D2	Enabled	Edit	View
03	Marketing	Enabled	Edit	View

Figure 323 – Configuration > IGMP Snooping Configuration

By default, IGMP is *Disabled*. If *Enabled*, the IGMP Global Settings will need to be entered:

Query Interval (60-600 sec): The Query Interval is the interval between General Queries sent. By adjusting the Query Interval, the number of IGMP messages can increase or decrease; larger values cause IGMP Queries to be sent less often. Default is 125 seconds.

Max Response Time (10-25 sec): The Max Response Time specifies the maximum allowed time before sending a responding report. Adjusting this setting effects the "leave latency", or the time between the moment the last host leaves a group and when the routing protocol is notified that there are no more members. It also allows adjustments for controlling the frequency of IGMP traffic on a subnet. Default is 10 seconds.

Robustness Variable (1-255 sec): The Robustness Variable allows adjustment for the expected packet loss on a subnet. If a subnet is expected to be lossy, the Robustness Variable may be increased. The Robustness Variable can not be set zero, and SHOULD NOT be one. Default is 2 seconds.

Last Member Query Interval (1-25 sec): The Last Member Query Interval is the Max Response Time inserted into Group-Specific Queries sent in response to Leave Group messages, and is also the amount of time between Group-Specific Query messages. This value may be adjusted to modify the "leave latency" of the network. A reduced value results in reduced time to detect the loss of the last member of a group. Default is 1 second.

Host Timeout (130-1225 sec): This is the interval after which a learnt host port entry will be purged. For each host port learnt, a 'PortPurgeTimer' runs for 'HostPortPurgeInterval'. This timer will be restarted whenever a report message from host is received over that port. If no report messages are received for 'HostPortPurgeInterval' time, the learnt host entry will be purged from the multicast group. Default is 260 seconds.

Router Timeout (60-600 sec): This is the interval after which a learnt router port entry will be purged. For each router port learnt, a 'RouterPortPurgeTimer' runs for 'RouterPortPurgeInterval'. This timer will be restarted whenever a router control message is received over that port. If no router control messages are received for 'RouterPortPurgeInterval' time, the learnt router port entry will be purged. Default is 125 seconds.

Leave Timer (0-25 sec): This is the interval after which a Leave message is forwarded on a port. When a leave message from a host for a group is received, a group-specific query is sent to the port on which the leave message is received. A timer is started with a time interval equal to IgsLeaveProcessInterval. If a report message is received

before above timer expires, the Leave message is dropped. Otherwise the Leave message is either forwarded to the port. Default is 1 second.

To enable IGMP snooping for a given VLAN, select *Enable* and click on the *Apply* button. Then press the *Edit* button under **Router Port Setting**, and select the ports to be assigned for IGMP snooping for the VLAN, and press **Apply** for changes to take effect.

Figure 334 – Configuration > IGMP Router port Settings

To view the Multicast Entry Table for a given VLAN, press the **View** button.

Figure 345 – Configuration > IGMP Multicast Entry Table

Configuration > 802.1D Spanning Tree

802.1D Spanning Tree Protocol (STP) implementation is a backup link(s) between switches, bridges or routers designed to prevent network loops that could cause a broadcast storm. When physical links forming a loop provide redundancy, only a single path will be forwarding frames. If the link fails, STP activates a redundant link automatically.

Port	Path Cost	Priority	State
01	19	128	Forward
02	19	128	Forward
03	19	128	Forward
04	19	128	Forward
05	19	128	Forward
06	19	128	Forward
07	19	128	Forward
08	19	128	Forward

Figure 356 – Configuration > Spanning Tree

By default, Spanning Tree is *Disabled*. If *Enabled*, the Switch will listen for BPDU packets and its accompanying Hello packet. BPDU packets are sent even if a BPDU packet was not received. Therefore, each link between bridges is sensitive to the status of the link. Ultimately this difference results in faster detection of failed links, and thus faster topology adjustment. A draw-back of 802.1D is this absence of immediate feedback from adjacent bridges.

After *Enabling* STP, setting the STP Global Setting includes the following options:

Bridge Priority: This value between 0 and 65535 specifies the priority for forwarding packets: the lower the value, the higher the priority. The default is 32768.

Bridge Max Age: This value may be set to ensure that old information does not endlessly circulate through redundant paths in the network, preventing the effective propagation of the new information. Set by the Root Bridge, this value will aid in determining that the Switch has spanning tree configuration values consistent with other devices on the bridged LAN. If the value ages out and a BPDU has still not been received from the Root Bridge, the Switch will start sending its own BPDU to all other switches for permission to become the Root Bridge. If it turns out that the Switch has the lowest Bridge Identifier, it will become the Root Bridge. A time interval may be chosen between 6 and 40 seconds. The default value is 20.

Bridge Hello Time: The user may set the time interval between transmissions of configuration messages by the root device, thus stating that the Switch is still functioning. The default is 2 seconds. (Max Age has to have a value bigger than Hello Time)

Bridge Forward Delay: This sets the maximum amount of time that the root device will wait before changing states. The default is 15 seconds.

Root Bridge: Displays the MAC address of the Root Bridge.

Root port: Displays the root port.

Root Path Cost: Shows the root path cost.

Path Cost: This defines a metric that indicates the relative cost of forwarding packets to specified port list. The lower the number, the

greater the probability the port will be chosen to forward packets. The default value is 19.

Path Priority: Select a value between 0 and 255 to specify the priority for a specified port for forwarding packets: the lower the value, the higher the priority. The default is 128.

Configuration > Port Mirroring

Port Mirroring is a method of monitoring network traffic that forwards a copy of each incoming and/or outgoing packet from one port of the Switch to another port where the packet can be studied. This enables network managers to better monitor network performances.

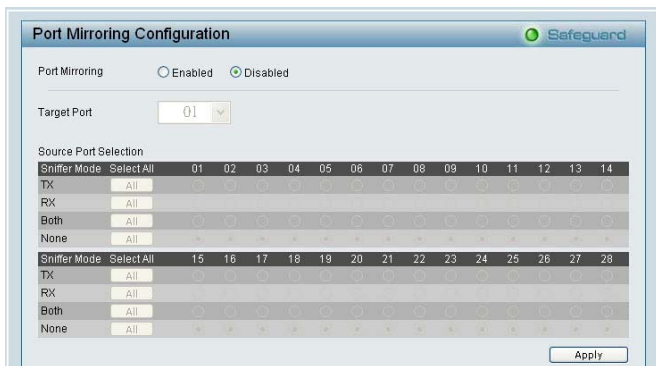

Figure 367 – Configuration > Port Mirroring

Selection options for the Source Ports are as follows:

TX (transmit) mode: Duplicates the data transmitted from the source port and forwards it to the Target Port.

RX (receive) mode: Duplicates the data that gets sent to the source and forwards it to the Target Port.

Both (transmit and receive) mode: Duplicate both the data transmitted from and data sent to the source port, and forwards all the data to the assigned Target Port.

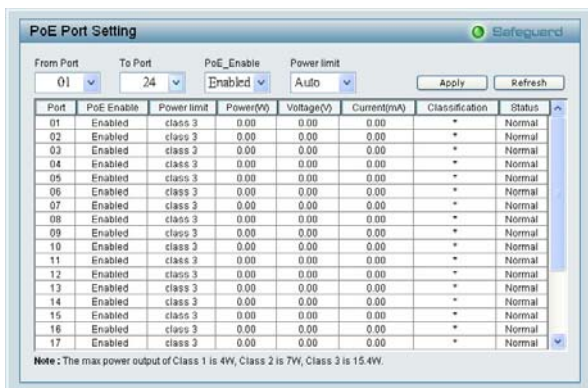

None: Turns off the mirroring of the port.

Power over Ethernet (PoE) > PoE Port Setting

Select "PoE Port Setting" to configure the PoE Port setting.

When you click on the PoE Setting, the PoE Status will appear on the screen. It will display the PoE status including, Port Enable, Power Limit, Power (W), Voltage (V), Current (mA), Classification, Port Status.

Note: The PoE Status information of Power current, Power Voltage, and Current is the power usage information of the connected PD; please "Refresh" to renew the information.

Port	PoE Enable	Power limit	Power(W)	Voltage(V)	Current(mA)	Classification	Status
01	Enabled	class 3	0.00	0.00	0.00	*	Normal
02	Enabled	class 3	0.00	0.00	0.00	*	Normal
03	Enabled	class 3	0.00	0.00	0.00	*	Normal
04	Enabled	class 3	0.00	0.00	0.00	*	Normal
05	Enabled	class 3	0.00	0.00	0.00	*	Normal
06	Enabled	class 3	0.00	0.00	0.00	*	Normal
07	Enabled	class 3	0.00	0.00	0.00	*	Normal
08	Enabled	class 3	0.00	0.00	0.00	*	Normal
09	Enabled	class 3	0.00	0.00	0.00	*	Normal
10	Enabled	class 3	0.00	0.00	0.00	*	Normal
11	Enabled	class 2	0.00	0.00	0.00	*	Normal
12	Enabled	class 3	0.00	0.00	0.00	-	Normal
13	Enabled	class 3	0.00	0.00	0.00	*	Normal
14	Enabled	class 3	0.00	0.00	0.00	*	Normal
15	Enabled	class 3	0.00	0.00	0.00	*	Normal
16	Enabled	class 3	0.00	0.00	0.00	*	Normal
17	Enabled	class 3	0.00	0.00	0.00	*	Normal

Note : The max power output of Class 1 is 4W, Class 2 is 7W, Class 3 is 15.4W.

Figure 38 – PoE > PoE Port Setting

PoE Enable: Select to enable or disable the PoE function.

Power Limit: This function allows you to manually set the port power current limitation to be given to the PD. To protect the DES-1228P and the connected devices, the power limit function will disable the PoE function of the port when the power is overloaded. Select from "Class 1 (4W)", "Class 2 (7W)", "Class 3 (15.4W)" and "Auto" for the power limit. "Auto" will negotiate and follow the classification from the PD power current based on the 802.3af standard.

Power over Ethernet (PoE) > PoE System Setting

Select "PoE System Setting" to configure the global PoE Settings.

Figure 39 – PoE > PoE System Setting

This page will display the PoE status including System Budget Power, Support Total Power, Remainder Power, and The ratio of system power supply.

System Power Threshold: When the ratio of the system power supply is larger than or smaller than the System Power Threshold Setting, the Switch will send trap events to the Management Station.

Note: When there is a system power shortage with the PD, the Switch will enforce the PoE port priority management. The lower port

numbers will have priority over the higher port numbers. For example, Port 1 > Port 2 > ... > Port 24.

QoS > 802.1p Default Priority

This feature displays the status Quality of Service priority levels of each port, and for packets that are untagged, the switch will assign the priority in the tag depending on your configuration.

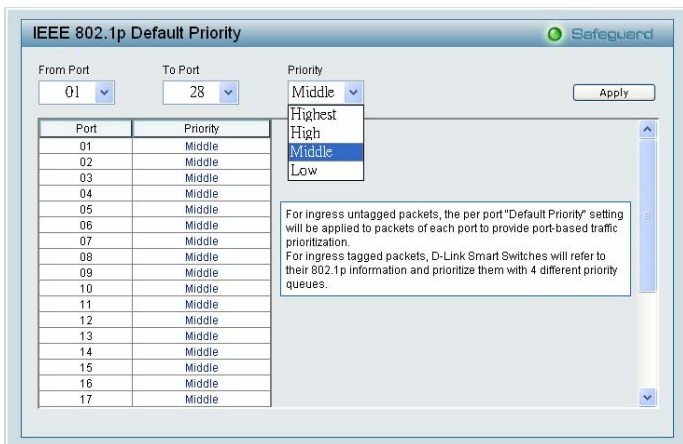

Figure 40 – QoS > 802.1p Default Priority

Security > Safeguard Engine

D-Link's **Safeguard Engine** is a robust and innovative technology that automatically throttles the impact of packet flooding into the switch's CPU. This function helps protect the Web-Smart Switch from being interrupted by malicious viruses or worm attacks. By default this is *Enabled*.

Figure 41 – Security > Safeguard Engine

Security > Broadcast Storm Control

The Broadcast Storm Control feature provides the ability to control the receive rate of broadcasted packets. If *Enabled* (default is *Disabled*), threshold settings of 8,000 ~ 4,096,000 bytes per second can be assigned. Press **Apply** for the settings to take effect.

Figure 42 – Security > Broadcast Storm Control

Security > 802.1X Setting

Network switches provide easy and open access to resources by simply attaching a client PC. Unfortunately this automatic configuration also allows unauthorized personnel to easily intrude and possibly gain access to sensitive data.

IEEE-802.1X provides a security standard for network access control, especially in Wi-Fi wireless networks. 802.1X holds a network port disconnected until authentication is completed. The switch uses Extensible Authentication Protocol over LANs (EAPOL) to exchange

authentication protocol client identity (such as a user name) with the client, and forward it to another remote RADIUS authentication server to verify access rights. The EAP packet from the RADIUS server also contains the authentication method to be used. The client can reject the authentication method and request another, depending on the configuration of the client software and the RADIUS server. Depending on the authenticated results, the port is either made available to the user, or the user is denied access to the network.

The RADIUS servers make the network a lot easier to manage for the administrator by gathering and storing the user lists.

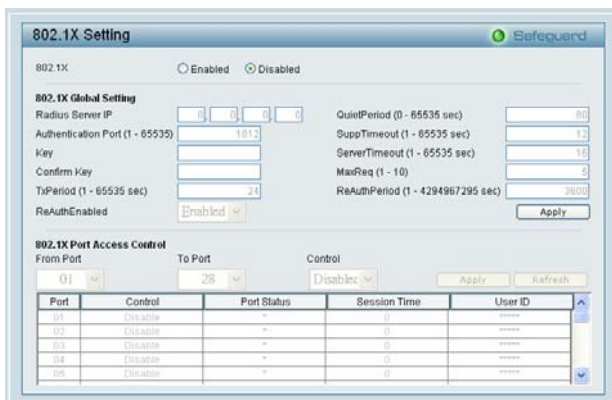

Figure 43 – Security > 802.1X Setting

By default, 802.1X is *Disabled*. To use EAP for security, select *Enabled* and set the 802.1X **Global Settings** for the Radius Server and applicable authentication information.

Authentication Port: sets primary port for security monitoring. Default is 1812.

Key: Masked password matching the Radius Server Key.

Confirm Key: Enter the Key a second time for confirmation.

TxPeriod: Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. Default is 24 seconds.

ReAuthEnabled: This *Enables* or *Disables* the periodic ReAuthentication control. When the 802.1X function is *Enabled*, the ReAuthEnabled function is by default also *Enabled*.

QuietPeriod: Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. Default 80 seconds

SuppTimeout: Sets the switch-to-client retransmission time for the EAP-request frame. Default is 12 seconds.

ServerTimeout: Sets the amount of time the switch waits for a response from the client before resending the response to the authentication server. Default is 16 seconds.

MaxReq: This parameter specifies the maximum number of times that the switch retransmits an EAP Request packet to the client before it times out the authentication session. Default is 5 times.

ReAuthPeriod: This command affects the behavior of the switch only if periodic re-authentication is enabled. Default is 3600.

To establish 802.1X port-specific assignments, select the **From** and **To Ports** and select *Enable*.

Security > Mac Address Table > Static Mac

This page provides two distinct features. The top table provides the ability to turn off auto learning Mac address if a port isn't connected to an uplink Switch (i.e. DHCP Server). By default, this feature is *OFF*

(disabled). The Macs listed on this table may only connect from corresponding ports and VIDs, in order to protect the network from illegal Macs.

Figure 44 – Security > Static Mac Address

To initiate the removal of auto-learning for any of the uplink ports, press *On* to enable this feature, and select the port(s) for auto learning to be disabled.

The **Static Mac Address Setting** table displays the static Mac addresses connected, as well as the VID. Press **Delete** to remove a device. To add a new Mac address assignment, press **Add Mac**, then select the assigned Port number, enter both the Mac Address and VID and press **Apply**.

Security > Mac Address Table > Dynamic Forwarding Table

For each port, this table displays the Mac address of each packet passing through the Switch. To add a Mac address to the Static Mac Address List, click the **Add** checkbox associated with the identified packet.

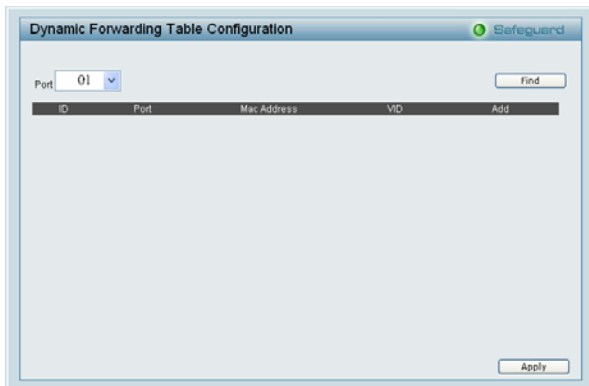

Figure 45 – Security > Dynamic Forwarding Table

Monitoring > Statistics

The Statistics screen displays the status of each port packet count.

Port	TxOK	RxOK	TxError	RxError
01	704	1008	0	0
02	0	0	0	0
03	0	0	0	0
04	0	0	0	0
05	0	0	0	0
06	0	0	0	0
07	0	0	0	0
08	0	0	0	0
09	0	0	0	0
10	0	0	0	0
11	0	0	0	0
12	0	0	0	0
13	0	0	0	0
14	0	0	0	0
15	0	0	0	0
16	0	0	0	0
17	0	0	0	0
18	0	0	0	0
19	0	0	0	0

Figure 46 – Monitoring > Statistics

Refresh: To renew the details collected and displayed.

Clear Counter: To reset the details displayed.

TxOK: Number of packets transmitted successfully.

RxOK: Number of packets received successfully.

TxError: Number of transmitted packets resulting in error.

RxError: Number of received packets resulting in error.

To view the statistics of individual ports, click one of the linked Port numbers for details.

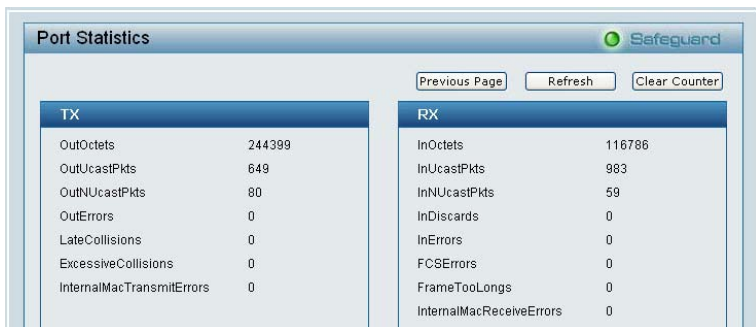

Figure 47 – Monitoring > Port Statistics
